

Session 06

Abstraction

One of the OOP Pillars that focuses on hiding complex implementation the abstract keyword can be added to the method signature or property signature to allow creating a body less method or a signature for property

Limitations

- you can NOT create an object from abstract class but you can use it as
- Can NOT be sealed

Static

Static is a keyword which allows any member to be accessible without needing to create an instance from that object

static class limitations

- ```
1- Cannot Create an instance from that class
2- cannot inherit from that class
```

## Sealed

---

Sealed is a keyword that can be used with a any member or type to make it not inheritable

## Partial Class

---

Its a class but split into 2 or more parts that's doesn't effect anything some people use it as a way of organizing work but really its not useable most of the time
